

What Is LNbitsBox?

LNbitsBox is a self-hosted Lightning appliance.

A Raspberry Pi image that boots into a working LNbits server, with the critical parts already wired together.

- First-run setup wizard
- LNbits with Phoenixd, Ark(ade) or Spark Lightning funding sources
- Tor hidden service
- Clearnet URL
- Admin control panel
- Wi-Fi config
- OTA updates
- Manual and rolling encrypted backup and recovery
- Local HTTPS with installable CA

Why?

Because sovereign self-hosting can be easy.

LNbitsBox gives you a fully self-contained Lightning appliance that is easy to set up, use, and maintain.

PERSONAL NODE

Run your own LNbits instance at home with no cloud account required for the core experience.

WORKSHOP DEVICE

Use it in a classroom, hackerspace, event booth, or hands-on Bitcoin workshop.

MERCHANT / PROJECT BOX

Prototype payments, private reachability, tunnels, updates, and recovery flows in the real world.

- Tor support for private reachability
- Admin panel for status, services, Wi-Fi, updates, and tunnels
- Built for demos: reset, reconfigure, update, recover

Why NixOS?

Because the box should be reproducible, not artisanal.

NixOS makes the whole appliance declarative: services, ports, files, packages, boot behavior, and update flow.

- Same config builds the same system image
- Easier OTA updates via immutable system generations
- Rollback-friendly when updates go wrong
- Services are explicit: LNbits, Spark sidecar, Caddy, Tor, admin app
- Great fit for appliances: define the state machine once, ship it as an image
