

LNbitsBox: Self-Hosted Lightning, Ready to Build On

Slide 1 - Intro who I am

Slide 2 - What Is LNbitsBox?

- LNbitsBox is a self-hosted Lightning appliance.
- It is an SD image and hardware that boots a fully functional LNbits instance, with everything wired together for a smooth first-run experience.
- Everything already wired together:
 - First-run setup wizard
 - LNbits with Phoenixd, Ark(ade) or Spark Lightning funding sources
 - Remote access via Tor and clearnet URLs
 - Admin control panel
 - OTA updates
 - Manual and rolling encrypted backup and recovery
 - Local HTTPS with installable CA

Slide 3 - Why?

- Because sovereign self-hosting Lightning can be easy.
- LNbitsBox gives you a fully self-contained Lightning appliance that is easy to set up, use, and maintain.
- Use cases:
 - Run your own LNbits instance at home
 - Put it in a shop, classroom, hackerspace, or workshop
 - Build a merchant, Lightning, or project box without depending on a cloud account for the core experience
- Core value:
 - Plug and play!
 - Easy remote access via clearnet and Tor
 - Admin panel for backups, updates and device monitoring

Slide 4 - Why NixOS?

- Because hardware for money should be reproducible.
- NixOS makes the appliance declarative:
 - Services
 - Ports
 - Files
 - Packages
 - Boot behavior
 - Update flow
- Why it matters:
 - Same config builds the same system image
 - Easier OTA updates via immutable system generations
 - Rollback-friendly when updates go wrong
 - Services are explicit: LNbits, funding sources, Caddy, Tor, admin app
 - Great fit for appliances: define the state and ship it
- Visual flow: flake.nix -> SD image -> Raspberry Pi -> reproducible LNbitsBox.

Speaker cue

"With NixOS, the product is not just the app. The product is the whole machine state."

Slide 5 - Demo

- Demo sequence:
 1. Configure the box
 2. Show the control panel. Step through set up with Phoenixd
 3. Set up remote clearnet access
 4. Show LNbits running with a funded wallet - make a test payment
